# Chapter 1

## Overview

### 1.1 Introduction

MIL-STD-1553 is a military standard for a serial data bus. It runs at 1MHz, and has one *bus controller* (BC) and up to 31 *remote terminals* (RTs) connected. There are also optional *bus monitor* (BM) devices. The protocol used on the bus is not described in this document, but there are several on-line resources on the net that covers 1553 in more detail.

### 1.2 1553 in Simics

The base of the MIL-STD-1553 support in Simics is a 1553 bus model, called **ms1553-link**, and its API. There is an example bus controller, written in DML with source code available, that models the *SμMMIT*-based *PMC1553* device from Alphi Technology. There is also a parameterized remote terminal dummy device that can be used for testing.

### 1.3 Implementation

The API to the 1553 link is implemented on a protocol level of abstraction and does not model the synchronization and parity bits of a real bus. However, it is still possible to model errors in the Manchester encoding and parity, for example, by injecting errors explicitly. The 1553 link in Simics keeps track of the protocol state, and warns when any device breaks the specification. The link also supports inspection of the data sent on it. The full 1553 link API is described in section [3.1](#), *Interfaces*.

### 1.4 Connecting to a Real 1553 Bus

A bus controller model can be connected to a real 1553 bus using the **host-pmc-1553** class or the **host-condor-pci-1553** class. The **host-pmc-1553** class supports any simulated BC that implements the standard Simics 1553 interface, and requires a real PMC1553 device on the host including drivers from Alphi Technology. The source code for this host connection is available, and can be used as an example when interfacing other bus controllers to implement a host bus connection. The **host-condor-pci-1553** class works as a bridge between RT models

#### *1.4. Connecting to a Real 1553 Bus*

in Simics and an actual Condor PCI 1553 card on the host. The card emulates RTs which also are represented as models in Simics.

## Chapter 2

# Simulation Models

Simics implements the following MIL-STD-1553 related classes. For more detailed information about them, refer to [chapter 4](#).

### 2.1 PMC1553 BC

**PMC1553** is a model of the  $S\mu$ MMIT-based MIL-STD-1553 module from Alphi Technology.

### 2.2 MS1553 Link/Bus

The **ms1553-link** models a MIL-STD-1553 bus, called link in Simics. It provides interfaces to bus controllers, remote terminal devices and bus monitors. The link keeps track of the protocol state to aid debugging of 1553 device and driver development. It also supports error injection and data inspection.

### 2.3 MS1553 RT

This **ms1553\_rt** is an example model of a remote terminal (RT) according to the MIL-STD-1553 standard. The RT can either connect to a virtual ms1553-bus or real ms1553-bus. The *link* connector connects the RT to a virtual bus. The *bridge* connector connects the RT to a real bus via a *bridge*. The *bridge* controls a host card that emulates the RT. The emulated RT is referred to as the shadow RT, as it is identical to the RT in the Simics world. It is up to the RT in Simics to keep the shadow RT in sync with itself.

### 2.4 MS1553 Test RT

Simple MIL-STD-1553 Remote Terminal used for testing. This RT can be configured with a number of sub-addresses using the *sub\_addresses* attribute. For each sub-address, a static list of 16-bit words should be supplied that specifies what the RT will return on “Transmit” requests. The data may be 1 up to 32 words in length. For “Receive” requests, the RT will report the received words using Simics standard log functions.

## 2.5 Condor PCI 1553 Host Connection

The **host-condor-pci-1553** class is a layer between RTs in Simics and a host Condor PCI 1553 card. The RTs in Simics are emulated by the host card. It is not possible for the RTs in Simics to control message transfers directly in real time. This is due to hard timing restrictions for the real MIL-STD-1553 bus connected to the host card. The emulated RTs (shadow RTs) are set up by the RTs in Simics to make them respond to messages as they would have done. The RTs in Simics get a copy of the messages handled by the shadow RTs. The **host-condor-pci-1553** class sets up the host card when new instance of the class is created. It creates a emulated RT when a Simics RT connect to it. The class includes the possibility to test RTs in Simics by emulating a simple bus controller. The bus controller is setup using the *bc\_test* attribute. This class requires the Condor BusTools 1553-API to be installed on the host to work. Only one instance of this component is allowed in a simulation session.

## 2.6 PMC1553 Host Controller Connection

The **host-pmc-1553** provides a connection from a simulated 1553 Bus Controller to a real Alphi PMC-1553 device, allowing the simulated controller to access devices on a real MIL-STD-1553 bus. The **host-pmc-1553** object should be connected directly to the simulated 1553 bus controller device in place of of the *ms1553-link*.

To compile the **host-pmc-1553** module, a driver development kit from Alphi Technology is required. The Alphi Technology PMC 1553 driver, needed to use this module, supports Windows 2000 and has also been tested on Windows Server 2003 SE.

## Chapter 3

# 1553 API

Below is a description of the 1553 interfaces used by devices in Simics. For documentation of the complete Simics API, refer to the *Simics Reference Manual*.

### 3.1 Interfaces

#### 3.1.1 ms1553\_link

**Implemented By**

host-pmc-1553, ms1553-link

**Description**

**Execution Context**

Instruction Context for all methods.

#### 3.1.2 ms1553\_terminal

**Implemented By**

PMC1553, ms1553-recorder-bm, ms1553-test-rt, ms1553\_rt

**Description**

**Execution Context**

Instruction Context for all methods.

#### 3.1.3 ms1553\_bridge\_terminal

**Implemented By**

ms1553\_rt

**Description**

**Execution Context**

Instruction Context for all methods.

**3.1.4 ms1553\_bridge\_bus****Implemented By**

host-condor-pci-1553

**Description****Execution Context**

Instruction Context for all methods.

**3.2 Types****3.2.1 ms1553\_phase\_t**

```
typedef enum {
    MS1553_Phase_Idle,
    MS1553_Phase_T_Command,
    MS1553_Phase_R_Command,
    MS1553_Phase_M_T_Command,
    MS1553_Phase_M_R_Command,
    MS1553_Phase_M_N_Command,
    MS1553_Phase_Data,
    MS1553_Phase_Status,
    MS1553_Num_Phases
} ms1553_phase_t;
```

**3.2.2 ms1553\_error\_t**

```
typedef enum {
    MS1553_Err_Manchester,
    MS1553_Err_Sync_Field,
    MS1553_Err_Word_Count,
    MS1553_Err_Parity,
    MS1553_Err_Protocol
} ms1553_error_t;
```

**3.2.3 ms1553\_words\_t**

```
typedef struct {
    int length;
    uint16 *data;
} ms1553_words_t;
```

**3.2.4 ms1553\_mode\_code\_t**

```
typedef enum {
    MS1553_Dynamic_Bus_Control = 0,
```

```

MS1553_Synchronize_T = 1,
MS1553_Transmit_Status_word = 2,
MS1553_Initiate_Self_Test = 3,
MS1553_Transmitter_Shutdown = 4,
MS1553_Override_Transmitter_Shutdown = 5,
MS1553_Inhibit_Terminal_Flag_Bit = 6,
MS1553_Override_Inhibit_Terminal_Flag_Bit = 7,
MS1553_Reset_Remote_Terminal = 8,
MS1553_Transmit_Vector_Word = 16,
MS1553_Synchronize_R = 17,
MS1553_Transmit_Last_Command_Word = 18,
MS1553_Transmit_BIT_Vector = 19,
MS1553_Selected_Transmitter_Shutdown = 20,
MS1553_Override_Selected_Transmitter_Shutdown = 21
} ms1553_mode_code_t;

```

### 3.2.5 ms1553\_dir\_t

```

typedef enum {
    MS1553_Dir_Transmit = 0,
    MS1553_Dir_Receive = 1
} ms1553_dir_t;

```

### 3.2.6 ms1553\_shadow\_word\_t

```

typedef enum {
    MS1553_Shadow_Word_Command = 0,
    MS1553_Shadow_Word_Status = 1,
    MS1553_Shadow_Word_BIT = 2,
    MS1553_Shadow_Word_Vector = 3
} ms1553_shadow_word_t;

```

# Chapter 4

## Class Details

Following is a list of all component and configuration classes used to implement 1553 in Simics. For documentation of other classes, refer to the *Model Builder Reference Manual*.

### 4.1 Components

#### 4.1.1 pci-pmc1553

**Provided By**

mil-std-1553-components

**Interfaces Implemented**

component, component\_connector, conf\_object, log\_object

**Description**

The “pci-pmc1553” component represents a PMC-1553PCI based MIL-STD-1553 Bus Controller.

**Connectors**

Name	Type	Direction
pci-bus	pci-bus	up
link-a	ms1553-link	down
link-b	ms1553-link	down

**Attributes**

*instantiated*

**Optional** attribute; **read/write** access; type: `boolean`. Set to TRUE if the component has been instantiated.

*object\_prefix*

**Optional** attribute; **read/write** access; type: `string` or `nil`. Object prefix string used by the component. The prefix is typically set by the **set-component-prefix** command before the component is created.

***top\_component***

**Optional** attribute; **read/write** access; type: `object` or `nil`. The top level component. Attribute is not valid until the component has been instantiated.

**Class Attributes*****basename***

**Pseudo class** attribute; **read-only** access; type: `string`. The basename of the component.

***component\_icon***

**Pseudo class** attribute; **read-only** access; type: `string` or `nil`. Name of a 24x24 pixels large icon in PNG format used to graphically represent the component in a configuration viewer.

***top\_level***

**Pseudo class** attribute; **read-only** access; type: `boolean` or `nil`. Set to `TRUE` for top-level components, i.e. the root of a hierarchy.

**Command List****Commands defined by interface `conf_object`**

`break-hap`, `get-attribute-list`, `get-interface-list`, `get-interface-port-list`, `list-attributes`, `list-interfaces`, `log`, `log-group`, `log-level`, `log-size`, `log-type`, `trace-hap`, `unbreak-hap`, `untrace-hap`, `wait-for-log`

**Commands**

**info**      print information about the device  
**status**    print status of the device

**Command Descriptions**

**<pci-pmc1553>.info**

**Synopsis**

**<pci-pmc1553>.info**

**Description**

Print detailed information about the configuration of the device.

**<pci-pmc1553>.status**

**Synopsis**

**<pci-pmc1553>.status**

**Description**

Print detailed information about the current status of the device.

### 4.1.2 std-ms1553-link

#### Provided By

mil-std-1553-components

#### Interfaces Implemented

component, component\_connector, conf\_object, log\_object

#### Description

The “std-ms1553-link” component represents a MIL-STD-1553 bus/link.

#### Connectors

Name	Type	Direction
device	ms1553-link	any

#### Attributes

##### *instantiated*

**Optional** attribute; **read/write** access; type: `boolean`. Set to `TRUE` if the component has been instantiated.

##### *object\_prefix*

**Optional** attribute; **read/write** access; type: `string` or `nil`. Object prefix string used by the component. The prefix is typically set by the **set-component-prefix** command before the component is created.

##### *top\_component*

**Optional** attribute; **read/write** access; type: `object` or `nil`. The top level component. Attribute is not valid until the component has been instantiated.

#### Class Attributes

##### *basename*

**Pseudo class** attribute; **read-only** access; type: `string`. The basename of the component.

##### *component\_icon*

**Pseudo class** attribute; **read-only** access; type: `string` or `nil`. Name of a 24x24 pixels large icon in PNG format used to graphically represent the component in a configuration viewer.

##### *top\_level*

**Pseudo class** attribute; **read-only** access; type: `boolean` or `nil`. Set to `TRUE` for top-level components, i.e. the root of a hierarchy.

## Command List

### Commands defined by interface `conf_object`

break-hap, get-attribute-list, get-interface-list, get-interface-port-list, list-attributes, list-interfaces, log, log-group, log-level, log-size, log-type, trace-hap, unbreak-hap, untrace-hap, wait-for-log

### Commands

**info** print information about the device  
**status** print status of the device

## Command Descriptions

### `<std-ms1553-link>.info`

#### Synopsis

`<std-ms1553-link>.info`

#### Description

Print detailed information about the configuration of the device.

### `<std-ms1553-link>.status`

#### Synopsis

`<std-ms1553-link>.status`

#### Description

Print detailed information about the current status of the device.

## 4.2 Classes

### 4.2.1 PMC1553

#### Provided By

PMC1553

#### Interfaces Implemented

`conf_object`, `io_memory`, `log_object`, `ms1553_terminal`, `pci_device`

#### Ports

HRESET (signal), SRESET (signal), bc (int\_register, io\_memory), pci\_config (int\_register, io\_memory), pmc (int\_register, io\_memory), rt (int\_register, io\_memory), summit (int\_register, io\_memory)

#### Description

**PMC1553** is a model of the  $S\mu$ MMIT-based MIL-STD-1553 module from Alphi Technology.

**Attributes*****AB\_STD***

**Optional** attribute; **read/write** access; type: `integer`. Select the standard, 0 for 1553B and 1 for 1553A

***AUTOEN***

**Optional** attribute; **read/write** access; type: `boolean`. Enable auto-initialization

***EXT\_TCLK***

**Optional** attribute; **read/write** access; type: `integer`. Frequency in Hz of external TCLK

***LOCK***

**Optional** attribute; **read/write** access; type: `boolean`. Assert LOCK to prevent modification of status word

***MSEL***

**Optional** attribute; **read/write** access; type: `integer`. SμMMIT Mode Selection: 0 for BC and 1 for RT.

***RTA***

**Optional** attribute; **read/write** access; type: `integer`. Remote Terminal Address

***SSYSF***

**Optional** attribute; **read/write** access; type: `boolean`. Subsystem Flag

***cmd\_info***

**Optional** attribute; **read/write** access; type: `dictionary`. Current command information

***config\_registers***

**Pseudo** attribute; **read-only** access; type: `[i*]`. The PCI configuration registers, each 32 bits in size.

***expansion\_rom\_size***

**Optional** attribute; **read/write** access; type: `integer`. The size of the expansion ROM mapping.

***link***

**Optional** attribute; **read/write** access; type: `[o|[os]|n{2}]`. The MIL-STD-1553 bus/link that the device is connected to.

***pci\_bus***

**Required** attribute; **read/write** access; type: `[os]` or `object`. The PCI bus this device is connected to, implementing the `pci-bus` interface.

***pci\_config\_command***

**Optional** attribute; **read/write** access; type: `integer`. The PCI command register.

*pci\_config\_device\_id*

**Optional** attribute; **read/write** access; type: `integer`. The Device ID of the PCI device

*pci\_config\_vendor\_id*

**Optional** attribute; **read/write** access; type: `integer`. The Vendor ID of the PCI device

*rom\_image*

**Optional** attribute; **read/write** access; type: `[os]`, `object`, or `nil`. Image holding the contents for auto-initialization, the required size of bytes is

- 1088 for RT mode,
- 64 for MT mode,
- 64 + [N x 16] for BC mode, N: number of command block

*sram*

**Required** attribute; **read/write** access; type: `[os]` or `object`. Object for dual ported SRAM. The image of this object must be the object specified in the *sram\_image* attribute.

*sram\_image*

**Required** attribute; **read/write** access; type: `[os]` or `object`. Image holding SRAM contents. The size must be 128KiB. This object must be the same as the image for the object specified in the *sram* attribute.

## Command List

### Commands defined by interface *conf\_object*

break-hap, get-attribute-list, get-interface-list, get-interface-port-list, list-attributes, list-interfaces, log, log-group, log-level, log-size, log-type, trace-hap, unbreak-hap, untrace-hap, wait-for-log

### Commands

<b>hard-reset</b>	hard reset
<b>info</b>	print information about the device
<b>pci-header</b>	<i>deprecated</i> — print PCI device header
<b>print-pci-config-regs</b>	print PCI configuration registers
<b>soft-reset</b>	soft reset
<b>status</b>	print status of the device

## Command Descriptions

<PMC1553>.hard-reset

### Synopsis

<PMC1553>.hard-reset

### Description

hard reset pmc1553 device

**<PMC1553>.info****Synopsis****<PMC1553>.info****Description**

Print detailed information about the configuration of the device.

**<PMC1553>.pci-header — *deprecated*****Synopsis****<PMC1553>.pci-header [-v]****Description**

This command is deprecated; use <PMC1553>.print-pci-config-regs instead.

**<PMC1553>.print-pci-config-regs****Synopsis****<PMC1553>.print-pci-config-regs [-v]****Description**

Print the PCI configuration registers. The *-v* flag turns on verbose mode.

**<PMC1553>.soft-reset****Synopsis****<PMC1553>.soft-reset****Description**

soft reset pmc1553 device

**<PMC1553>.status****Synopsis****<PMC1553>.status****Description**

Print detailed information about the current status of the device.

### 4.2.2 ms1553-link

#### Provided By

ms1553-link

#### Interfaces Implemented

conf\_object, log\_object, ms1553\_link

#### Description

The **ms1553-link** models a MIL-STD-1553 bus, called link in Simics. It provides interfaces to bus controllers, remote terminal devices and bus monitors. The link keeps track of the protocol state to aid debugging of 1553 device and driver development. It also supports error injection and data inspection.

#### Command List

##### Commands defined by interface conf\_object

break-hap, get-attribute-list, get-interface-list, get-interface-port-list, list-attributes, list-interfaces, log, log-group, log-level, log-size, log-type, trace-hap, unbreak-hap, untrace-hap, wait-for-log

##### Commands

<b>capture-start</b>	start traffic recorder
<b>capture-stop</b>	stop traffic recorder
<b>info</b>	print information about the device
<b>playback-start</b>	start traffic generator
<b>playback-stop</b>	stop traffic generation
<b>status</b>	print status of the device

#### Command Descriptions

**<ms1553-link>.capture-start**

##### Synopsis

**<ms1553-link>.capture-start** *filename*

##### Description

Starts recording bus traffic to a specified file, in a format that can be played back. If the file exist, it is silently overwritten.

##### See Also

**<ms1553-link>.capture-stop**

**<ms1553-link>.capture-stop**

##### Synopsis

**<ms1553-link>.capture-stop**

**Description**

Stop recording bus traffic previously started with start-recorder.

**See Also**

<ms1553-link>.playback-start

**<ms1553-link>.info****Synopsis**

<ms1553-link>.info

**Description**

Print detailed information about the configuration of the device.

**<ms1553-link>.playback-start****Synopsis**

<ms1553-link>.playback-start *filename*

**Description**

Starts generating bus traffic from a specified file. The file should be of PASS-3200 dump format.

**See Also**

<ms1553-link>.capture-start, <ms1553-link>.playback-stop

**<ms1553-link>.playback-stop****Synopsis**

<ms1553-link>.playback-stop

**Description**

Stop bus traffic generation previously started with playback-start.

**See Also**

<ms1553-link>.playback-start

**<ms1553-link>.status****Synopsis**

<ms1553-link>.status

**Description**

Print detailed information about the current status of the device.

### 4.2.3 ms1553\_rt

**Provided By**

ms1553-rt

**Interfaces Implemented**

conf\_object, log\_object, ms1553\_bridge\_terminal, ms1553\_terminal

**Description**

This **ms1553\_rt** is an example model of a remote terminal (RT) according to the MIL-STD-1553 standard. The RT can either connect to a virtual ms1553-bus or real ms1553-bus. The *link* connector connects the RT to a virtual bus. The *bridge* connector connects the RT to a real bus via a *bridge*. The *bridge* controls a host card that emulates the RT. The emulated RT is referred to as the shadow RT, as it is identical to the RT in the Simics world. It is up to the RT in Simics to keep the shadow RT in sync with itself.

**Attributes**

*disconnect\_bridge*

**Pseudo** attribute; **read/write** access; type: `integer`. Disconnect from bridge.

*last\_command*

**Optional** attribute; **read/write** access; type: `integer`. The last command word.

*status\_word*

**Optional** attribute; **read/write** access; type: `integer`. The status word of the RT.

*sub\_addresses*

**Required** attribute; **read/write** access; type: `[[[i[i*][i*]]*]]`. The Terminal Address of the RT.

*terminal\_address*

**Required** attribute; **read/write** access; type: `integer`. The terminal address of the RT.

**Command List**

**Commands defined by interface conf\_object**

break-hap, get-attribute-list, get-interface-list, get-interface-port-list, list-attributes, list-interfaces, log, log-group, log-level, log-size, log-type, trace-hap, unbreak-hap, untrace-hap, wait-for-log

### 4.2.4 ms1553-test-rt

**Provided By**

ms1553-test-rt

**Interfaces Implemented**

conf\_object, log\_object, ms1553\_terminal

**Description**

Simple MIL-STD-1553 Remote Terminal used for testing. This RT can be configured with a number of sub-addresses using the *sub\_addresses* attribute. For each sub-address, a static list of 16-bit words should be supplied that specifies what the RT will return on “Transmit” requests. The data may be 1 up to 32 words in length. For “Receive” requests, the RT will report the received words using Simics standard log functions.

**Attributes***sub\_addresses*

**Required** attribute; **read/write** access; type: `[[i[i*]]*]`. A list of sub-addresses that the RT will implement, and for each sub-address there is a non-empty list of up to 32 16-bit words that are returned on reads from that sub-address.

*terminal\_address*

**Required** attribute; **read/write** access; type: `integer`. The Terminal Address of the RT.

**Command List****Commands defined by interface *conf\_object***

break-hap, get-attribute-list, get-interface-list, get-interface-port-list, list-attributes, list-interfaces, log, log-group, log-level, log-size, log-type, trace-hap, unbreak-hap, untrace-hap, wait-for-log

**4.2.5 host-condor-pci-1553****Provided By**

host-condor-pci-1553

**Interfaces Implemented**

*conf\_object*, *log\_object*, *ms1553\_bridge\_bus*

**Description**

The **host-condor-pci-1553** class is a layer between RTs in Simics and a host Condor PCI 1553 card. The RTs in Simics are emulated by the host card. It is not possible for the RTs in Simics to control message transfers directly in real time. This is due to hard timing restrictions for the real MIL-STD-1553 bus connected to the host card. The emulated RTs (shadow RTs) are set up by the RTs in Simics to make them respond to messages as they would have done. The RTs in Simics get a copy of the messages handled by the shadow RTs. The **host-condor-pci-1553** class sets up the host card when new instance of the class is created. It creates a emulated RT when a Simics RT connect to it. The class includes the possibility to test RTs in Simics by emulating a simple bus controller. The bus controller is setup using the *bc\_test* attribute. This class requires the Condor BusTools 1553-API to be installed on the host to work. Only one instance of this component is allowed in a simulation session.

**Command List****Commands defined by interface conf\_object**

break-hap, get-attribute-list, get-interface-list, get-interface-port-list, list-attributes, list-interfaces, log, log-group, log-level, log-size, log-type, trace-hap, unbreak-hap, untrace-hap, wait-for-log

**4.2.6 host-pmc-1553****Provided By**

host-pmc-1553

**Interfaces Implemented**

conf\_object, log\_object, ms1553\_link

**Description**

The host-pmc-1553 provides a connection from a simulated 1553 Bus Controller to a real Alphi PMC-1553 device, allowing the simulated controller to access devices on a real MIL-STD-1553 bus. The host-pmc-1553 object should be connected directly to the simulated 1553 bus controller device in place of the ms1553-link.

To compile the host-pmc-1553 module, a driver development kit from Alphi Technology is required. The Alphi Technology PMC 1553 driver, needed to use this module, supports Windows 2000 and has also been tested on Windows Server 2003 SE.

**Command List****Commands defined by interface conf\_object**

break-hap, get-attribute-list, get-interface-list, get-interface-port-list, list-attributes, list-interfaces, log, log-group, log-level, log-size, log-type, trace-hap, unbreak-hap, untrace-hap, wait-for-log
